### **RESUMPTION OF ON GROUND EXPLORATION AT CLAUDE HILLS AND WINGELLINA**

Acclaim Exploration (ASX code: AEX) is pleased to announce that ground geophysical testing of magnetic anomalies has commenced at Claude Hills and Wingellina, in the Musgrave region.

The start of fieldwork, originally scheduled for early June, was delayed by several weeks of heavy unseasonal rain.

Reconnaissance ground magnetic traverses to confirm the position of anomalies identified from the regional aeromagnetic data sets have been encouraging. The first anomaly tested gave a strong response, with a peak of approximately 1500 nanoteslas. The causative magnetic body is in the order of 400 metres long and has a width of approximately 100 metres. The model depth is less than 100 metres, but there is no surface expression as the anomaly is covered by sand wash.

The twelve anomalies selected for testing cover a number of geological settings, ranging from interpreted "feeder dykes" within the felsic basement gneiss to basal contact positions on the larger layered intrusions. Inspection of three anomalies in areas dominated by felsic gneiss have revealed outcropping cumulate textured mafic rocks of the type frequently associated with nickel sulphide mineralisation.

The Drillers have commenced mobilization and already have their camp and a rod truck on site. Drilling to test the anomalies is scheduled to commence late next week.

The Company's work on the Anangu Pitjantjatjara lands has the support of the Land Council Executive and the Traditional Owners, who have assisted in the identification and avoidance of culturally sensitive areas.
